

Salesforce Apex Trailhead Solutions

This document contains the Apex code snippets generated during our conversations. Each section includes the challenge name and the primary file/class name.

Create an Apex class that returns a list of strings

File Name: StringListTestCopy.cls

```
public class StringListTestCopy {
    public static List<String> generateStringListCopy(Integer IntegerCopy) {
        List<String> stringList = new List<String>();
        for (Integer i = 0; i < IntegerCopy; i++) {
            stringList.add('Test ' + i);
        }
        return stringList;
    }
}
```

Insert Account

File Name: AccountHandler.cls

```
public class AccountHandler {
    public static Account insertNewAccount(String accountName) {
        try {
            Account acc = new Account(Name = accountName);
            insert acc;
            return acc;
        } catch (DmlException e) {
            return null;
        }
    }
}
```

Search Contacts

File Name: ContactSearch.cls

```
public class ContactSearch {
    public static List<Contact> searchForContacts(String lastName, String
postalCode) {
        return [SELECT Id, Name FROM Contact
                WHERE LastName=:lastName
                AND MailingPostalCode=:postalCode];
    }
}
```

Search Contacts and Leads (SOSL)

File Name: ContactAndLeadSearch.cls

```
public class ContactAndLeadSearch {
    public static List<List<SObject>> searchContactsAndLeads(String
searchTerm) {
```

```

        return [FIND :searchTerm IN ALL FIELDS
                RETURNING Contact(Id,FirstName,LastName),
                        Lead(Id,FirstName,LastName)];
    }
}

```

Accounts by State

File Name: AccountUtils.cls

```

public class AccountUtils {
    public static List<Account> accountsByState(String state){
        return [SELECT Id,Name FROM Account
                WHERE BillingState=:state];
    }
}

```

Account Wrapper Test

File Name: AccountWrapperTests.cls

```

@isTest
public class AccountWrapperTests {
    @TestSetup
    static void setupData() {
        Account acc = new Account(Name='Test Account');
        insert acc;
        Opportunity opp = new Opportunity(
            Name='Test Opportunity',
            AccountId=acc.Id,
            StageName='Prospecting',
            CloseDate=Date.today(),
            Amount=150000
        );
        insert opp;
    }

    @isTest
    static void testIsHighPriority() {
        Account acc = [SELECT Id FROM Account LIMIT 1];
        AccountWrapper wrapper = new AccountWrapper(acc);
        Test.startTest();
        Decimal avg = wrapper.getRoundedAvgPriceOfOpps();
        Boolean result = wrapper.isHighPriority();
        Test.stopTest();
        System.assert(avg > 100000);
        System.assertEquals(true, result);
    }

    @isTest
    static void testException() {
        Account acc = new Account(Name='No Opportunity');
        insert acc;
        AccountWrapper wrapper = new AccountWrapper(acc);
        Test.startTest();
        try{

```

```
        wrapper.getRoundedAvgPriceOfOpps();
        System.assert(false);
    } catch (AccountWrapper.AWException e) {
        System.assertEquals('No won Opportunities', e.getMessage());
    }
    Test.stopTest();
}
```
